

Energy Transition – A Status Report

David Glynne Jones

Sunday 7 April at 3.00pm

Manning Clark House, Tasmania Circle, Forrest

In the first of a series of presentations during 2024 on the Energy Transition issue, David Glynne Jones will report on the current status, key trends and outlook for the global transition to a low emission energy economy. His report will focus on energy transition at the global level and in Australia, as well as key high emitting economies including China, USA, India, Europe and Russia.

David will outline the Energy Transition series, which will include presentations on Australia's National Electricity Market, low emission energy technologies, transport electrification, land use and environmental impacts, energy resource stewardship and the circular energy economy, and the politics of energy transition.

David is an independent advocate for the adoption of renewable energy and electrification across all sectors of the Australian economy. He is currently assessing the implications of emerging advanced battery technology for electrification of the Australian transport sector and, together with his colleague Derek Woolner, publishing articles on the implications of emerging energy technologies for defence policy, strategy and future acquisition programs.

There will be a Q&A session following the presentation, then light refreshments.

MCH members \$15; Concession (Gov't support and full-time students) \$15; Non-members \$20
